Tuesday's Trauma

- There was no 'hard limit' of 400 participants
 - The infrastructure just happened to start suffering at around the 400 participant mark
 - Meetecho was load-tested before launch, however due to our last-minute requested changes to the platform, we introduced additional unexpected load.
- Web socket timeouts, we DDoSed ourselves 🤖
 - Quick fix on Tuesday afternoon was to increase the timeout for clients
 - Root cause was fixed Tuesday evening

After Tuesday

- A few more edge cases
 - Happy Eyeballs potentially interfering with a participant's session
 - Browsers with cookies/fingerprinting blocked
 - Safari in general
 - Mobile experience
- The good stuff
 - First time we could all collaborate on a single platform using an open-source technology - <https://github.com/meetecho/janus-gateway>
 - No need to install software on your own devices
 - No regional restrictions, available to everyone across the globe

How did it go?

- Feedback is more important than ever before
- Thanks to everyone who helped us debug issues!
